## Chapter 10 Exam AK

1. Which of the diatomic molecules are gases?

Hydrogen, fluorine, nitrogen, oxygen, and chlorine.
2. What is the difference between a gas and a vapor?

Gases are a phase that is highly energetic with low attractive forces at room temperature. Solids and liquids at room temperature can sometimes form a gaseous phase. This phase is called a vapor because not all of the matter present is in one phase.
3. A liquid and a gas are moved to large containers (let's keep the volume the same for both containers). How does their behavior differ once they are moved from a small container to a larger container?
The gas will expand to fill the new container, assuming the shape and volume of the container. The liquid will assume the shape of the container which it occupies, but does not expand to fill the volume.
4. Although liquid water and carbon tetrachloride $\left(\mathrm{CCl}_{4}\right)$ do not mix, their vapors form a homogeneous mixture. Give an explanation based on the behavior of liquids and gases to explain this phenomenon.
Liquid molecules are close together, while gas molecules have more space between them. The vapors of these two liquids mix because they are not interacting with attractive or repulsive forces. The space between the molecules is large enough to sustain differences in attractive forces.
5. (4 points) An ideal gas initially at 710 torr and $30.59^{\circ} \mathrm{C}$ occupies 2600 mL . Calculate the final temperature in ${ }^{\circ} \mathrm{C}$, if the conditions are changed to a pressure of 1.20 atm and volume of 3.25 L

| 1.20 atm | 760 torr | 3.25 L | $30.59 \mathrm{~K}+273.15 \mathrm{~K}$ |
| :--- | :--- | :--- | :--- |
| 710 torr | 1 atm | 2.6 L |  |$=487.70 \mathrm{~K}$

487.70K $-273.15 \mathrm{~K}=214.55 \mathrm{~K}, 215{ }^{\circ} \mathrm{C}$ (2SF) $2.1 \mathrm{X} 10^{20} \mathrm{C}$
6. (6 points) A 23.5-mL volume of hydrochloric acid reacts completely with a solid sample of $\mathrm{MgCO}_{3}$. The volume of $\mathrm{CO}_{2}$ formed is 154 mL at $25.98^{\circ} \mathrm{C}$ and 731.6 mmHg . What is the molarity of the acid solution?
$2 \mathrm{HCl}_{(\mathrm{aqq})}+\mathrm{MgCO}_{3(\mathrm{~s})} \rightarrow \mathrm{CO}_{2(\mathrm{~g})}+\mathrm{H}_{2} \mathrm{O}_{(1)}+\mathrm{MgCl}_{2(\mathrm{aq})}$
Strategy: solve for moles of carbon dioxide, equate to moles HCl , find molarity.

|  | HCl | $\mathrm{CO}_{2}$ |
| :--- | :--- | :--- |
| Moles |  |  |
| P |  | $731.6 \mathrm{mmHg}, \mathrm{O} .9626 \mathrm{~atm}$ |
| V | $23.6 \mathrm{~mL}, 0.0236 \mathrm{~L}$ | $154 \mathrm{~mL}, 0.154 \mathrm{~L}$ |
| T |  | $25.98^{\circ} \mathrm{C}, 299.13 \mathrm{~K}$ |

$$
\begin{aligned}
& P=731.6 \mathrm{mmHg} X \frac{1 \mathrm{~atm}}{760 \mathrm{mmHg}}=0.9626 \mathrm{~atm} \\
& V(\text { gas })=154 \mathrm{~mL} x \frac{10^{-3} \mathrm{~L}}{1 \mathrm{~mL}}=0.154 \mathrm{~L} \\
& V(\text { acid })=23.5 \mathrm{~mL} x \frac{10^{-3} \mathrm{~L}}{1 \mathrm{~mL}}=0.0235 \mathrm{~L} \\
& 25.98^{\circ} \mathrm{C} x \frac{1 \mathrm{~K}}{1^{\circ} \mathrm{C}}+276.15 \mathrm{~K}=299.13 \mathrm{~K} ; P \mathrm{~V}=n R \mathrm{~T}, \text { solving for moles of gas, } \\
& \frac{P V}{R T}=\frac{0.96263 \mathrm{~atm} x 0.154 \mathrm{~L}}{\frac{0.08206 \mathrm{Latm}}{\mathrm{Kmol}} \times 299.13 \mathrm{~K}}=0.0060393 \mathrm{~mol} \mathrm{CO} \\
& \\
& 0.0060393 \mathrm{~mol} \mathrm{CO}_{2} \times \frac{2 \mathrm{HCl}}{1 \mathrm{CO}_{2}} \times \frac{1}{0.0235 \mathrm{~L}}=0.514 \mathrm{M} \mathrm{HCl}
\end{aligned}
$$

7. (6 points) Cyanogen, a highly toxic gas, is composed of $46.2 \mathrm{~g} \% \mathrm{C}$ and $53.8 \% \mathrm{~N}$ by mass. At $25^{\circ} \mathrm{C}$ and 750 torr, 1.05 g of cyanogen occupies 0.500 L . What is the molecular formula of cyanogen.

| 46.2 g C | 1 mol C | $=3.847 \mathrm{~mol} \mathrm{C}$ | $\mathbf{C}$ | 3.847 mol C | 1.00 C |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  | 12.01 g C |  |  |  |  |
| 53.8 g N | 1 mol N | 3.840 mol N |  | 1.071 mol N | 1 N |
|  | 14.01 g N |  |  |  |  |

CN, formula mass is $26.02 \mathrm{~g} / \mathrm{mol}$

| 750 torr | 1 atm | 0.500 L | $\mathrm{~K} \cdot \mathrm{~mol}$ |
| :--- | :--- | :--- | :--- |
|  | 760 torr | $(25 \mathrm{~K}+$ | 0.08206 |
|  |  | $273.15 \mathrm{~K})$ | $\mathrm{L} \cdot \mathrm{atm}$ |$\quad=0.02017 \mathrm{~mol}$ cyanogen

$1.05 \mathrm{~g} / 0.02017 \mathrm{~mol}$ cyanogen $=52.06 \mathrm{~g} / \mathrm{mol}$ cyanogen. There are two formula units of CN in the cyanogen molecule. The formula is $\mathrm{C}_{2} \mathrm{~N}_{2}$
8. (5 points) The rate of effusion of oxygen gas at $0^{\circ} \mathrm{C}$ is $4,61 \mathrm{X} 10^{2} \mathrm{~m} / \mathrm{sec}$, what is the rate of $\mathrm{SO}_{2}$ gas at the same pressure and temperature?

$$
\frac{\text { rate } \mathrm{SO}_{2}}{\text { rate } \mathrm{O}_{2}}=\sqrt{\frac{M M O_{2}}{M M S O_{2}}} ; \frac{\text { rate } \mathrm{SO}_{2}}{\frac{4.61 \times 10^{2} m}{s}}=\sqrt{\frac{\frac{31.9988 \mathrm{~g}}{\mathrm{~mol}}}{\frac{64.064 \mathrm{~g}}{\mathrm{~mol}}}} 326 \mathrm{~m} / \mathrm{s}
$$

9. (4 points) Suppose you were marooned on a tropical island and had to make a primitive barometer using sea water (density $=1.10 \mathrm{~g} / \mathrm{mL}$ ). What height would the water reach in your sea water barometer when a mercury barometer would reach 77.5 cm ? $\mathrm{d}(\mathrm{Hg})=$ $13.6 \mathrm{~g} / \mathrm{mL} . \mathbf{h}_{1} \mathbf{d}_{1}=\mathbf{h}_{2} \mathbf{d}_{\mathbf{2}}$

## $\frac{13.6 \mathrm{~g} \mathrm{Hg} / \mathrm{mL} \mathrm{x} 77.5 \mathrm{~cm} \text { high }}{1.10 \mathrm{~g} \text { sea water } / \mathrm{mL}} 958 \mathrm{~cm}$ high <br> 1. 10 g sea water $/ \mathrm{mL}$

10. (4 points) A gas cylinder with a volume of 6.00 L contains 1.00 g of Ar and 2.00 g of Ne. The temperature of the two gases is 294 K .
a. Find the partial pressure of each gas.
b. Find the mole fraction of each gas.

Moles of the gases

| 1.00 g Ar | 1 mol Ar |
| :--- | :--- | :--- | :--- |$=0.02503 \mathrm{~mol} \mathrm{Ar} \quad$| 2.00 g Ne |
| :--- |
|  |
|  |
|  |
| 39.948 g Ar |$\quad 1 \mathrm{~mole} \mathrm{Ne} \quad=0.09911 \mathrm{~mol} \mathrm{Ne}$

| $\mathrm{P}_{\text {Ar }}$ | $\mathrm{N}_{\text {Ar }}$ |
| :--- | :--- |
| $\mathrm{P}_{\text {total }}$ | $\mathrm{N}_{\text {total }}$ |

| $\mathrm{P}_{\mathrm{Ne}}$ | $\mathrm{n}_{\mathrm{Ne}}$ |
| :--- | :--- |
| $\mathrm{P}_{\text {total }}$ | $\mathrm{N}_{\text {total }}$ |

Mole fraction of each gas

| $\mathrm{X}_{\text {Ar }}$ | $\begin{aligned} & 0.02503 \mathrm{~mol} \\ & \mathrm{Ar} \end{aligned}$ | 0.202 | $\mathrm{X}_{\mathrm{Ne}}$ | $\begin{aligned} & 0.09911 \mathrm{~mol} \\ & \mathrm{Ne} \end{aligned}$ | $=0.798$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & 0.124 \mathrm{~mol} \\ & \text { total } \end{aligned}$ |  |  | 0.124 |  |

You could also solve for the total pressure of the gases, and use Dalton's Law to solve for the individual pressures.

$$
\begin{array}{r}
P \mathrm{Ar}=\frac{0.02503 \mathrm{~mol} \mathrm{Ar} \cdot 0.08206 \cdot 294 \mathrm{~K}}{6.00 \mathrm{~L}}=[0.1006 \mathrm{~atm}] \text { ANS : 0. } 101 \mathrm{~atm} \\
P \mathrm{Ne}=\frac{0.09911 \mathrm{~mol} \mathrm{Ne} \cdot 0.08206 * 294 \mathrm{~K}}{6.00 \mathrm{~L}}=[0.3985 \mathrm{~atm}] \text { ANS:0.399 atm } \\
0.1006+0.3985=0.4991 \mathrm{~atm} \text { total pressure. Ans: } 0.499 \mathrm{~atm}
\end{array}
$$

11. (8 points ) A sample of nitrogen gas is at STP. The volume of the container is decreased while keeping the temperature constant. Use kinetic-molecular theory to explain whether each of the following would increase, decrease, or remain constant and WHY.
a) the average KE

The temperature is constant so the average KE is also constant. Changing the temperature would change the average KE.
b) the average speed

The average speed is dependent on the temperature. If the temperature increases, the molecules have more $K E$, but since the temperature is constant, the KE is constant, and the speed is also constant.
c) the frequency of the collisions

The frequency of the collisions is inversely proportional to the volume. There will be more collisions with the walls of the container, because the path that the molecules travel is shorter to have a successful collision with the container walls even though the KE is constant.
d) the frequency of collisions per unit area

The frequency of the collisions per unit area must go if the frequency of the collisions increases.
e) The pressure of the gas

Pressure is a measure of the number of collisions/unit area and the force/unit area. If the force stays the same (KE does not change) but the number of collisions increases, the pressure must also increase. This is the basis of Boyle's Law.
12. (4 points) A bicycle tires filled with air to a pressure of 100 . PSI at a temperature of $19^{\circ} \mathrm{C}$. Riding the bike on a hot day increases the temperature of the tire to $58^{\circ} \mathrm{C}$. The tire volume increases by $4.00 \%$. What is the new pressure in the tire?

Let the initial volume $=100 \mathrm{~L}$, then the final volume is 104 L

| 100. PSI | $100 . \mathrm{L}$ | $(58 \mathrm{~K}+273.15 \mathrm{~K})$ |
| :--- | :--- | :--- |
|  | $(19 \mathrm{~K}+273.15 \mathrm{~K})$ | 104 L |$=109 \mathrm{PSI}$

13. ( 6 points) Automobiles are equipped with airbags. Many that inflate with $\mathrm{N}_{2}$ use the rapid reaction of $\mathrm{NaN}_{3}+\mathrm{Fe}_{2} \mathrm{O}_{3}$ which is initiated by a spark. How many grams of $\mathrm{NaN}_{3}$ sodium azide) would be required to provide 75.0 L of $\mathrm{N}_{2}$ at $25.0^{\circ} \mathrm{C}$ and 748 mmHg ?
$6 \mathrm{NaN}_{3(\mathrm{~s})}+\mathrm{Fe}_{2} \mathrm{O}_{3(\mathrm{~s})} \rightarrow 3 \mathrm{Na}_{2} \mathrm{O}_{(\mathrm{s})}+2 \mathrm{Fe}_{(\mathrm{s})}+9 \mathrm{~N}_{2(\mathrm{~g})}$
moles of nitrogen gas

14. (6 points) Two flasks of equal volume are filled with a gas. Flask A contains $\mathrm{H}_{2}$ at $0^{\circ} \mathrm{C}$ and 1 atm pressure. Flask B contains $\mathrm{CO}_{2}$ at $25^{\circ} \mathrm{C}$ and 2 atm pressure. Compare these two gases, using the postulates of KMT, with respect to each of the following: [hint: start with a definition]
a. The average kinetic energy per molecule

The hydrogen gas has a lower average KE because the temperature of the gas is lower than that of the carbon dioxide. Average KE is $\propto$ to the temperature in kelvin.
b. The average molecular velocity.

Since the average KE is lower for the hydrogen, the average molecular velocity should be lower too. The velocity is $\propto$ the temperature as well; colder gases have lower average KE and therefore velocity because there are more molecules moving at a slower speed than at a faster speed. However, velocity is also dependent on molar mass. To determine the gas with the lower (or higher), use Grahams Law of Effusion. Let hydrogen be gas 1, and carbon dioxide, gas 2

$$
\frac{\text { rate }_{1}}{\text { rate }_{2}}=\sqrt{\frac{T 1}{M M 1} \cdot \frac{M M 2}{T 2}=\sqrt{\frac{273.15 \mathrm{~K}}{2.016 \mathrm{~g} / \mathrm{mol}} \cdot \frac{44.01 \mathrm{~g} / \mathrm{mol}}{298.15 \mathrm{~K}}}=\frac{4.47}{1}}
$$

because the Hydrogen Is lighter, it has a faster rate than the warmer carbon dioxide problem cont'd on next page
c. The number of molecules
$\mathbf{P V}=\mathrm{nRT}$, We don't know the moles of gas and we don't know the volume. We do know that the volumes are equal. We can rearrange the ideal gas law to reflect this:

$$
\underline{\text { moles }}=\frac{P V}{R T}
$$

thusly, the volume is a unit volume, and we are comparing the pressure to the temperature.

$$
\begin{aligned}
& \frac{\text { moles }}{m o l e s}=\frac{1 L \cdot 1 \mathrm{~atm}}{R \cdot 273.15 \mathrm{~K}}=0.0446 \mathrm{mols} \mathrm{H}_{2} \\
& \frac{1 \mathrm{~L} \cdot 2 \mathrm{~atm}}{R \cdot 298.15 \mathrm{~K}}=0.00817 \mathrm{mols} \mathrm{CO}_{2}
\end{aligned}
$$

The two gases are at different pressures and temperatures for the same volume. For this to be true, the number of moles must be different. $\mathrm{CO}_{2}$ has a larger number of moles. The size of the pressure is determined by the number of collisions with the walls of the container and the force of the collisions. Increasing the temperature causes more forceful collisions with the wall. The pressure increases.
d. The mass of the gas.

Heavier gases move slower than lighter gases. The hydrogen has a smaller molar mass, so even though it has a lower pressure, and a lower temperature, it will move faster than the heavier carbon dioxide molecules at a higher temperature and pressure.
15. (4 points) An incandescent light bulb is filled with $6.00 \times 10^{-5} \mathrm{~mol}$ of argon. The bulb has a volume of 800.0 mL . What is the pressure of the argon in the light bulb at $75^{\circ} \mathrm{C}$ ?

$$
P A r=\frac{6.00 \cdot 10^{-5} \mathrm{~mol} \mathrm{Ar} \bullet 0.08206 \bullet(75+273.15) \mathrm{K}}{0.8000 L}=\boldsymbol{A N S}:
$$

0.00214 atm
16. (12 points) A quantity of Neon gas originally at 5.25 atm in a $2.00-\mathrm{L}$ container at $26.0^{\circ} \mathrm{C}$ is transferred to a 12.5 L container at $20^{\circ} \mathrm{C}$. A quantity of He originally at 5.25 atm and $26.0^{\circ} \mathrm{C}$ in a $5.00-\mathrm{L}$ container is transferred to the same container $(12.5 \mathrm{~L})$ containing the neon.
a. ( 3 points) What is the pressure of the neon in the new container?
b. (3 points) What new pressure of the He gas?
c. (2 points) What is the total pressure of the new container?
d. (4 points) What are the mole fractions of He and Ne in the new container?

| $\mathrm{P}_{\mathrm{Ne}}$ |
| :--- | :--- | :--- | :--- |\(\quad \begin{array}{ll}5.25 \mathrm{~atm} \& 2.00 \mathrm{~L} <br>

\& 299.15 \mathrm{~K} <br>
\& <br>
\& <br>
\& <br>
\& 12.5 \mathrm{~L}\end{array} \quad .8232 \mathrm{~atm}\), to $3 \mathrm{SF}, 0.823 \mathrm{~atm}$

| $\mathrm{P}_{\text {He }}$ | 5.25 atm | 5.00L | 293.15K | 2.058 atm , to |
| :---: | :---: | :---: | :---: | :---: |
|  |  | 299.15K | 12.5 L |  |
| $\mathrm{P}_{\text {total }}=2.058+0.8232=2.881 \mathrm{~atm} .2 .88 \mathrm{~atm}$ |  |  |  |  |
| $\mathrm{P}_{\text {Ar }}$ | $\mathrm{N}_{\text {Ar }}$ |  | $\mathrm{P}_{\mathrm{Ne}}$ | $\mathrm{n}_{\mathrm{Ne}}$ |
| $\mathrm{P}_{\text {total }}$ | $\mathrm{N}_{\text {total }}$ |  | $\mathrm{P}_{\text {total }}$ | $\mathrm{N}_{\text {total }}$ |

Mole fraction of each gas

| $\mathrm{X}_{\mathrm{Ne}}$ | 0.8232 atm | $0.2858, \mathbf{0 . 2 8 6}$ | $\mathrm{X}_{\mathrm{He}}$ | 2.058 atm |
| :--- | :--- | :--- | :--- | :--- |
|  | 2.881 atm |  |  |  |

17. (6 points) If the atmospheric pressure is 0.995 atm , what is the pressure of the enclosed gas in each of the two open ended manometers. Assume the grey material is mercury. ${ }^{1}$
$\mathrm{H}_{1} 52 \mathrm{~cm}$
$\mathrm{H}_{2}=67 \mathrm{~cm}$
$\mathrm{H}_{3}=10.3 \mathrm{~cm}$

In a closed end manometer, the pressure exert is the height of the column of mercury, the $\mathbf{P}$ is 520 mmHg . The problem, though, is asking about the open end manometers.
In the second manometer, the atmospheric pressure is exerting a force on the gas. The pressure of the gas is
$P_{\text {gas }}=P_{\text {atm }}-P_{\text {height }}, 0.995 \mathrm{~atm}-670 \mathrm{mmHg} / 760 \mathrm{mmHg}=0.113 \mathrm{~atm}$, to the correct $\mathrm{SF}, 0.11$ atm
In the third manometer, the gas is exerting a force on the atmosphere. The pressure of the gas is $P_{\text {gas }}=P_{\text {atm }}+P_{\text {height }}, 0.995 \mathrm{~atm}+103 \mathrm{mmHg} / 760 \mathrm{mmHg} 1.13 \mathrm{~atm}$
18. (4 points) What is the molar mass of a compound that takes 2.0 times longer to effuse through a porous plug than it did for the same amount of $\mathrm{XeF}_{2}$ at the same temperature and pressure?
The rate of effusion for the $\mathrm{XeF}_{2}=1 / 2$ the rate of the unknown compound, or the rate of the unknown is twice that of the xenon difluoride. This tells me that the unknown is heavier than the xenon difluoride.

$$
\frac{\mu_{X e F_{2}}}{\mu_{x}}=\sqrt{\frac{M M_{x}}{M M_{X e F_{2}}}}
$$

[^0]$$
\frac{\mu_{X e F_{2}}}{\mu_{x}}=\frac{2}{1}=\sqrt{\frac{M M_{x}}{169.3 \mathrm{~g} / \mathrm{mol}}}
$$
molar mass is $677.2 \mathrm{~g} / \mathrm{mol}$
19. (4 points) An ideal gas initially at $1,209 \mathrm{mmHg}$ and $30.00^{\circ} \mathrm{C}$ occupies $2,600 . \mathrm{mL}$. Calculate the final temperature in ${ }^{\circ} \mathbf{C}$, if the conditions are changed to a pressure of 1.50 atm and volume of 5.32 L

| 1.50 atm | 760 mmHg | $5,320 \mathrm{~mL}$ | $30.00 \mathrm{~K}+273.15 \mathrm{~K}$ |
| :---: | :--- | :--- | :--- |$=582.87 \mathrm{~K}$

582.87K $-273.15 \mathrm{~K}=309^{\circ} \mathrm{C}$ (3SF)
20. (6 points) A self-contained breathing apparatus uses canisters containing potassium superoxide, $\mathrm{KO}_{2}$. The superoxide consumes the $\mathrm{CO}_{2}$ exhaled by a person and replaces it with oxygen. What mass of potassium superoxide is required to react with 8.00 L of carbon dioxide at $22.0^{\circ} \mathrm{C}$ and 767 mmHg ?

| $4 \mathrm{KO}_{2(\mathrm{~s})}+2 \mathrm{CO}_{2(g)} \rightarrow 2 \mathrm{~K}_{2} \mathrm{CO}_{3(\mathrm{~s})}+3 \mathrm{O}_{2(g)}$ |  |  |  |  |  |
